

Auto Ticket Classification using Flow Designer

Project Documentation

1. Introduction

- **Project Title:** Auto Ticket Classification using Flow Designer (ServiceNow)
- **Team Members:** Team ID SWTID-2026-2451
 - **Mithuna Devi M** – Requirement analysis
 - **Dharaga P** – Backend development (custom table, fields, dependent choices), testing ,validation & email notification planning
 - **Mithilasri KB** – Flow Designer automation, Update Set, deployment & final documentation

2. Project Overview

- **Purpose:** Automate classification of school IT helpdesk tickets (Wi-Fi, projector, password, slow computer) to reduce manual effort and improve routing.
- **Features:** Automatic Category & Subcategory from Short description keywords; dependent choice fields; auto-numbered ticket records; confirmation email to the caller; no-code and easy to maintain.

3. Architecture

- **Frontend:** ServiceNow form (Form Designer) – user enters Caller and Short description only.
- **Backend:** Flow Designer flow “Auto Classify School IT Tickets” – trigger: Record Created where Category is empty; If / Else-If keyword logic; Update Record; Send Email.
- **Database:** Custom table Incident WorkFlow (u_incident_workflow): Number, Caller, Category, Subcategory, Short description, Description, State, Assigned group, Assigned to.

4. Setup Instructions

- **Prerequisites:** ServiceNow instance with admin access; Flow Designer (Workflow Studio).
- **Installation:** Create the Update Set “Project Update Set” (Global) and make it current; create the table Incident WorkFlow with auto-number (prefix INC); add fields and choices; make Subcategory dependent on Category; build the flow.

5. Folder Structure

- **Table:** u_incident_workflow with the fields listed above.
- **Flow:** Auto Classify School IT Tickets (Global).
- **Update Set:** Project Update Set, exported as XML.

6. Running the Application

- Activate the flow and test it from the Incident WorkFlow table.
 - **Flow:** Flow Designer → open the flow → Activate.
 - **Test:** Incident WorkFlow → New → enter Caller and Short description → Submit; reload the form.

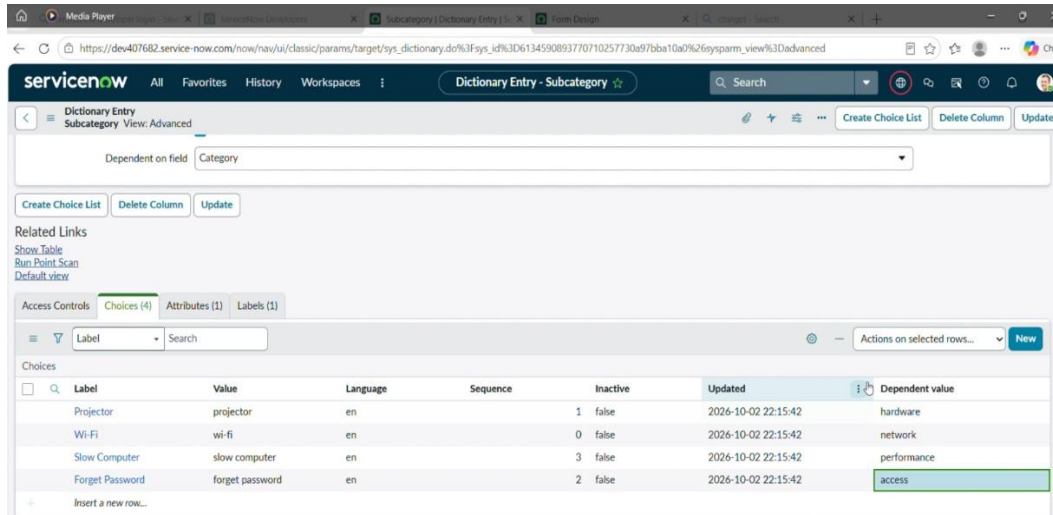

7. API Documentation (Flow Rules)

- No REST endpoints are exposed; classification is done by the flow on record creation. Short description contains:
 - **Wi-Fi or Network** → Category: Network, Subcategory: Wi-Fi
 - **Projector** → Category: Hardware, Subcategory: Projector
 - **Forgot password** → Category: Access, Subcategory: Forgot Password
 - **Slow computer** → Category: Performance, Subcategory: Slow Computer
- Then a Send Email action mails the Caller: “Your Request for the issue has been submitted.”

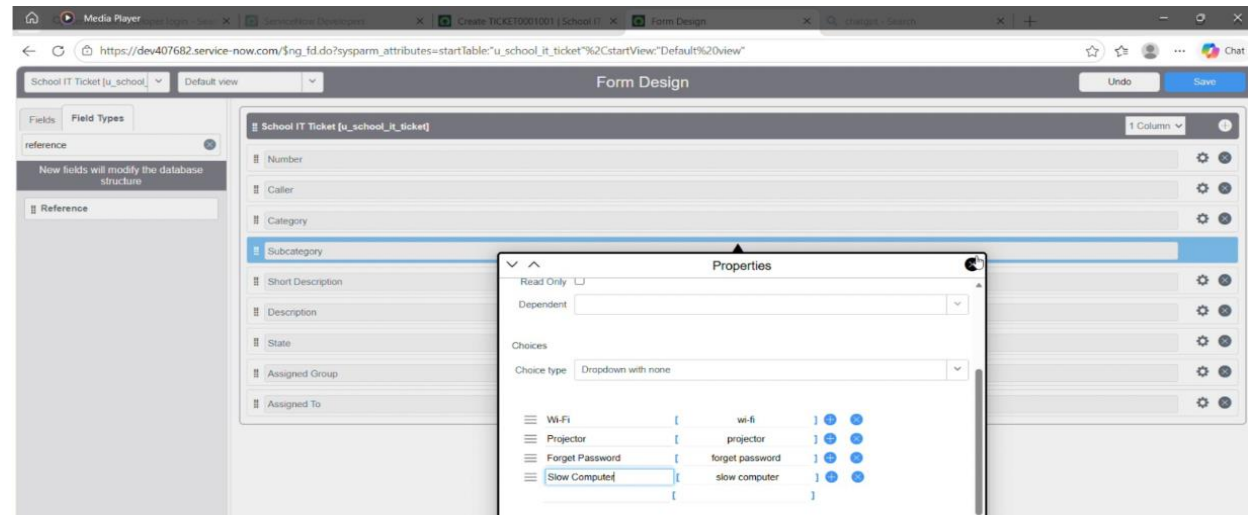

8. Authentication

- Authorization is role-based: the table's access control uses the role `u_incident_workflow_user`; the admin configures the table, fields and flow.
- Caller is a reference to `sys_user`; users sign in through the ServiceNow session (no custom tokens).

9. User Interface

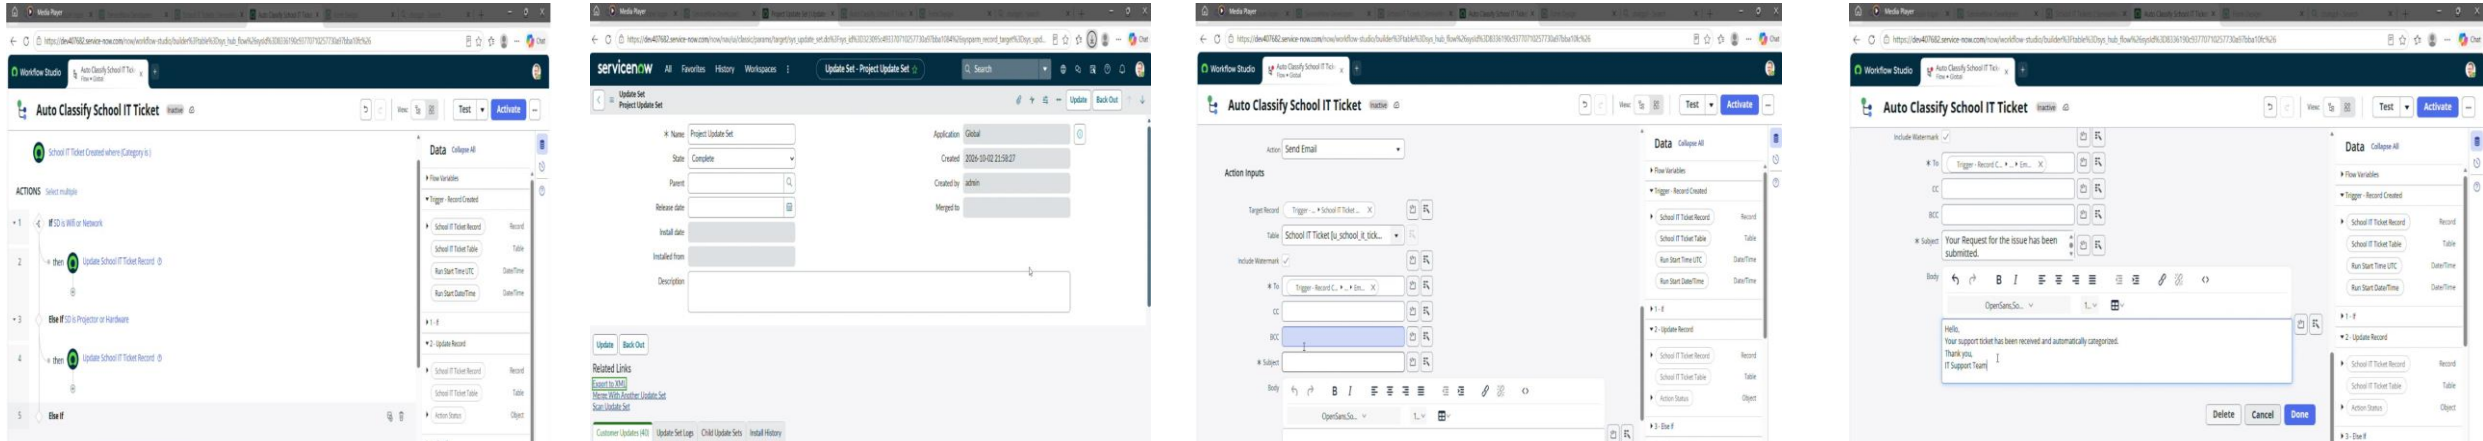

Label	Value	Language	Sequence	Inactive	Updated	Dependent value
Projector	projector	en	1	false	2026-10-02 22:15:42	hardware
Wi-Fi	wi-fi	en	0	false	2026-10-02 22:15:42	network
Slow Computer	slow computer	en	3	false	2026-10-02 22:15:42	performance
Forget Password	forget password	en	2	false	2026-10-02 22:15:42	access

10. Testing

- **Strategy:** Manual end-to-end functional testing in ServiceNow; checks for mandatory fields, unique auto-number, correct Category/Subcategory, reference fields and email logs.
 - **Scenario 1:** “WiFi not working in library” → Network / Wi-Fi + email sent
 - **Scenario 2:** “Projector not turning on” → Hardware / Projector + email sent

11. Screenshots or Demo

12. Known Issues

- Classification relies on exact keywords/phrases; misspelt or unlisted wording is not matched.
- Only four issue types are covered; the flow runs only when Category is empty.
- The email body is a generic confirmation without ticket details.

13. Future Enhancements

- Auto-assignment of Assigned group / Assigned to; SLA tracking.
- Predictive Intelligence and more categories/keywords.
