

Project Design Phase Proposed Solution Template

Date	
Team ID	SWTID-2026-2451
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Proposed Solution Template:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	The school IT helpdesk gets many requests daily from students and teachers (Wi-Fi, projector, password, slow computer). IT staff review each ticket by hand to pick a category and subcategory, which is slow, error-prone, and does not scale as requests grow.
2.	Idea / Solution description	A ServiceNow Flow Designer automation. When a ticket is created with Category empty, the flow checks the Short description for keywords (Wi-Fi/Network, Projector, Password/Login, Slow/Hanging), sets Category and Subcategory, and emails the caller a confirmation. The caller only enters their name and a short description.
3.	Novelty / Uniqueness	Fully no-code: built with Flow Designer, dependent choice fields, and a custom table, with no scripting or machine learning. Rules are easy to read and change, and the whole project moves between instances as an update set.
4.	Social Impact / Customer Satisfaction	Students and teachers get their issues routed faster and know their request arrived. Less repetitive sorting lets IT staff spend more time fixing problems, so classrooms and labs get back to learning sooner.
5.	Business Model (Revenue Model)	Built on the school's existing ServiceNow platform, so there is no extra licence or development cost. Value comes from staff time saved. It can be offered as a ready-made update set to other schools and colleges.
6.	Scalability of the Solution	New keywords, categories, and subcategories are added in Flow Designer without code. It can be extended with auto-assignment to groups, SLA tracking, and predictive intelligence, and it scales with the ServiceNow platform as ticket volume grows.
