

AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

Project Report

1. INTRODUCTION

- **1.1 Project Overview**

The school IT helpdesk receives multiple incident requests daily from students and teachers, such as Wi-Fi issues, projector failures, password problems, and slow computers.

IT staff currently review each request and assign a category manually.

This project automates ticket classification using ServiceNow Flow Designer by analyzing keywords in the Short Description and Description fields.

- **1.2 Purpose**

Automatically classify incidents at the time of creation.

Reduce manual effort for IT agents.

Improve ticket routing efficiency.

Implement a no-code, easily maintainable solution.

2. IDEATION PHASE

- **2.1 Problem Statement**

Manual review of IT tickets is time-consuming, error-prone, and not scalable as the number of requests increases.

- **2.2 Empathy Map Canvas**

Students and teachers need a simple support-request process; IT staff need consistent ticket information and faster classification.

- **2.3 Brainstorming**

Use ServiceNow Flow Designer to analyze predefined keywords and automatically assign Category and Subcategory.

3. REQUIREMENT ANALYSIS

- **3.1 Customer Journey map**

Caller enters ticket details → ticket is created → Flow Designer evaluates the description → Category and Subcategory are assigned → confirmation email is sent.

- **3.2 Solution Requirement**

Automatically classify IT tickets based on the issue description.

Assign Category and Subcategory without manual intervention.

Support dependent choice logic between Category and Subcategory.

Send an automated email notification to the caller.

Store ticket information in a structured and standardized format.

- **3.3 Data Flow Diagram**

Caller → Incident Workflow → Flow Designer → Keyword Classification → Category/Subcategory → Email Notification

- **3.4 Technology Stack**

- ServiceNow, Flow Designer, Incident Workflow table, Choice fields, Reference fields, Email Action, Update Set.

4. PROJECT DESIGN

- **4.1 Problem Solution Fit**

The solution addresses manual ticket categorization by automating classification when a ticket is created.

- **4.2 Proposed Solution**

Flow Designer is triggered when a record is created and Category is empty.

Wi-Fi / Network → Network / Wi-Fi

Projector → Hardware / Projector

Password / Login → Access / Forgot Password

Slow / Hanging → Performance / Slow Computer

- **4.3 Solution Architecture**

User Layer → Incident Workflow Table → Flow Designer → Classification Logic → Updated Ticket → Email Notification

5. PROJECT PLANNING & SCHEDULING

- **5.1 Project Planning**

Phase 1: Requirement Analysis & Planning

Phase 2: Backend Development & Configuration

Phase 3: Automation using Flow Designer & Email Notification

Phase 4: Testing, Validation & Security

Phase 5: Deployment & Final Documentation

6. FUNCTIONAL AND PERFORMANCE TESTING

- **6.1 Performance Testing**

Validate the end-to-end automation, data accuracy, and access control.

Mandatory fields are captured correctly.

Auto-number is generated without duplication.

Category and Subcategory values are stored accurately.

Reference fields resolve correctly to user and group tables.

Test Scenario 1: WiFi not working in library → Network / WiFi.

Test Scenario 2: Projector not turning on → Hardware / Projector.

7. RESULTS

• 7.1 Output Screenshots

Wi-Fi issue: Category → Network; Subcategory → WiFi; email sent to caller.

Projector issue: Category → Hardware; Subcategory → Projector; email sent to caller.

The supplied project document contains configuration and testing screenshots that can be placed on this slide.

8. ADVANTAGES & DISADVANTAGES

- **Advantages**

Reduces manual classification effort.

Improves ticket routing efficiency.

No-code and easy to maintain.

Provides structured and standardized data.

Automated email acknowledgement.

- **Disadvantages / Limitations**

Classification depends on predefined keywords.

New issue types require additional configuration.

Keyword variations may require additional conditions.

9. CONCLUSION

- **The Auto Ticket Classification using Flow Designer project delivers an end-to-end automation solution for a school IT helpdesk.**
- **The system automatically classifies IT tickets based on the short description provided by students.**
- **Dependent choice fields ensure data accuracy, while automated email notifications improve communication.**
- **The phased implementation supports clarity, stability, and ease of maintenance.**
- **Testing and security validation confirm reliable operation, data integrity, and appropriate access controls.**

10. FUTURE SCOPE

- **Extend the flow to support additional ticket categories and keywords.**
- **Add assignment automation for routing tickets to appropriate support groups.**
- **Introduce SLA tracking for monitoring response and resolution targets.**
- **Extend the solution toward predictive intelligence and advanced classification.**

APPENDIX. BUSINESS REQUIREMENTS

- **The system must automatically classify IT tickets based on the issue description.**
- **Assign both Category and Subcategory without manual intervention.**
- **Support dependent choice logic between Category and Subcategory.**
- **Send an automated email notification to the caller upon ticket creation.**
- **Store ticket information in a structured and standardized format.**
- **Ensure easy maintenance and future scalability.**
